Analyzing insider threats in the technology and software development industry using Cyber Security strategies.

Identify
Organization should maintain a baseline of communication and data flow between the third parties.

Protect
Organization should initiate a new access or additional access for employees, contractors and others involved within the organization and track, review and fulfil the request, with permission from system or data owners when needed.

Detect
Use behavior analytics software to detect anomalous user activity to mitigate insider threats.

Respond
Designat an incident lead for each incident.

Recover
Make all individuals with recovery responsibilities aware of the plans for recovery and the authorizations required to implement each aspect of plans.

Govern
Identify relevant internal stakeholders and their cyber security related expectations (e g., performance and risk expectations of officer, directors, and advisors; cultural expectations of employees).
